Models of Networking The type of network most widely implemented to day is based on the principle of having one or more file servers at the heart of the network. This kind of network is often referred to as a server-based or client-server network. There are however other models for implementing networks.

Network and Relational Data Modeling - Raima

A network model is a database model that is designed as a flexible approach to representing objects and their relationships. A unique feature of the network model is its schema, which is viewed as a graph where relationship types are arcs and object types are nodes. Unlike other database models, the network model's schema is not confined to be a lattice or hierarchy; the hierarchical tree is replaced by a graph, which allows for more basic connections with the nodes.

The network audit should provide you the network device list, hardware models, versions of software, configuration of network devices, interface speeds, link, CPU, bandwidth and memory utilization. In small network, you might be able to acquire the necessary information via a physical judgment, but for larger network, a manual assessment is a time-consuming.

Modeling and simulation (M&S) is a useful tool to evaluate the performance of computer networks both at the production and developmental phases. It is widely used by researchers, practitioners and students to analyze the behavior of computer networks, since disruptions or service performance degradations are avoided.
